

Discrete random variables:-

ex: a coin is tossed twice, define the R.v. x

to be the number of appearing heads in the

two tosses, determine the Range of x .

$S = \{ (HH), (HT), (TH), TT \} \rightarrow x: \text{num of heads}$

$\rightarrow \text{Range} = \{0, 1, 2\}$

→ A Random variable:-

is a function that associated a real number with each element in a sample space.

→ if the range of R.v is countable set (finite or infinite) then R.v is said to be discrete R.v
